Part B (BC): Graphing calculator not allowed Question 5

General Scoring Notes

Answers (numeric or algebraic) need not be simplified. Answers given as a decimal approximation should be correct to three places after the decimal point. Within each individual free-response question, at most one point is not earned for inappropriate rounding.

Scoring guidelines and notes contain examples of the most common approaches seen in student responses. These guidelines can be applied to alternate approaches to ensure that these alternate approaches are scored appropriately.

Let y = f(x) be the particular solution to the differential equation $\frac{dy}{dx} = y \cdot (x \ln x)$ with initial condition

f(1) = 4. It can be shown that f''(1) = 4.

	Model Solution	Scoring		
(a)	Write the second-degree Taylor polynomial for f about $x = 1$. Use the Taylor polynomial to approximate $f(2)$.			
	$f'(1) = \frac{dy}{dx}\Big _{(x, y)=(1, 4)} = 4 \cdot (1 \ln 1) = 0$	Polynomial	1 point	
	The second-degree Taylor polynomial for f about $x = 1$ is			

$$f(1) + f'(1)(x-1) + \frac{f''(1)}{2!}(x-1)^2 = 4 + 0(x-1) + \frac{4}{2}(x-1)^2.$$

$$f(2) \approx 4 + 2(2-1)^2 = 6$$
 Approximation **1 point**

Scoring notes:

- The first point is earned for $4 + \frac{4 \cdot \ln 1}{1!} (x-1)^1 + \frac{4}{2!} (x-1)^2$ or any correctly simplified equivalent expression. A term involving (x-1) is not necessary. The polynomial must be written about (centered at) x = 1.
- If the first point is earned, the second point is earned for just "6" with no additional supporting work.
- If the polynomial is never explicitly written, the first point is not earned. In this case, to earn the second point supporting work of at least "4 + 2(1)" is required.

9 points

(b) Use Euler's method, starting at x = 1 with two steps of equal size, to approximate f(2). Show the work that leads to your answer.

$f(1.5) \approx f(1) + 0.5 \cdot \frac{dy}{dx}\Big _{(x, y)=(1, 4)} = 4 + 0.5 \cdot 0 = 4$	Euler's metho two steps	od with 1 point
$f(2) \approx f(1.5) + 0.5 \cdot \frac{dy}{dx} \Big _{(x, y)=(1.5, 4)}$		
$\approx 4 + 0.5 \cdot 4 \cdot (1.5 \ln 1.5) = 4 + 3 \ln 1.5$	Answer	1 point

Scoring notes:

- The first point is earned for two steps (of size 0.5) of Euler's method, with at most one error. If there is any error, the second point is not earned.
- To earn the first point a response must contain two Euler steps, $\Delta x = 0.5$, use of the correct

expression for $\frac{dy}{dx}$, and use of the initial condition f(1) = 4.

• The two Euler steps may be explicit expressions or may be presented in a table. Here is a minimal example of a (correctly labeled) table.

x	у	$\Delta y = \frac{dy}{dx} \cdot \Delta x \text{ or } \Delta y = \frac{dy}{dx} \cdot (0.5)$
1	4	0
1.5	4	3 ln 1.5
2	$4 + 3 \ln 1.5$	

- Note: In the presence of the correct answer, such a table does not need to be labeled in order to earn both points. In the presence of an incorrect answer, the table must be correctly labeled for the response to earn the first point.
- A single error in computing the approximation of f(1.5) is not considered a second error if that incorrect value is imported correctly into an approximation of f(2).
- Both points are earned for " $4 + 0.5 \cdot 0 + 0.5 \cdot 4 \cdot (1.5 \ln 1.5)$ " or " $4 + 0.5 \cdot 4 \cdot (1.5 \ln 1.5)$ ".
- Both points are earned for presenting the ordered pair (2, 4 + 3ln 1.5) with sufficient supporting work.

(c) Find the particular solution y = f(x) to the differential equation $\frac{dy}{dx} = y \cdot (x \ln x)$ with initial condition f(1) = 4.

$\frac{1}{y}dy = x\ln xdx$	Separation of variables	1 point
Using integration by parts, $u = \ln x$ $du = \frac{1}{x} dx$ $dv = x dx$ $v = \frac{x^2}{2}$	Antiderivative for <i>x</i> ln <i>x</i>	1 point
$\int x \ln x dx = \frac{x^2}{2} \cdot \ln x - \int \frac{x^2}{2} \cdot \frac{1}{x} dx = \frac{x^2 \ln x}{2} - \frac{x^2}{4} + C$		
$\ln y = \frac{x^2 \ln x}{2} - \frac{x^2}{4} + C$	Antiderivative for $\frac{1}{y}$	1 point
$\ln 4 = 0 - \frac{1}{4} + C \implies C = \ln 4 + \frac{1}{4}$	Constant of integration and uses initial condition	1 point
$y = e^{\left(\frac{x^2 \ln x}{2} - \frac{x^2}{4} + \ln 4 + \frac{1}{4}\right)}$	Solves for <i>y</i>	1 point
Note: This solution is valid for $n > 0$		

Note: This solution is valid for x > 0.

Scoring notes:

- A response with no separation of variables earns 0 out of 5 points. If an error in separation results in one side being correct $(\frac{1}{y} dy \text{ or } x \ln x dx)$, the response is only eligible to earn the corresponding antiderivative point.
- The third point (antiderivative of $\frac{1}{y}$) can be earned for either ln y or $\ln |y|$.
- A response with no constant of integration can earn at most 3 out of 5 points.
- A response is eligible for the fourth point if it has earned the first point and at least 1 of the 2 antiderivative points.
- A response earns the fourth point by correctly including the constant of integration in an equation and then replacing x with 1 and y with 4.
- A response is eligible for the fifth point only if it has earned the first 4 points.
