19. Acid rain. Biologists studying the effects of acid rain on wildlife collected data from 163 streams in the Adirondack Mountains. They recorded the pH (acidity) of the water and the BCI, a measure of biological diversity. Following is a scatterplot of BCI against pH.

And here is part of the regression analysis:

Dependent variable is: BCI R-squared = 27.1%

s = 140.4 with 163 - 2 = 161 degrees of freedom

 Variable
 Coefficient
 SE(Coeff)

 Intercept
 2733.37
 187.9

 pH
 -197.694
 25.57

- a) State the null and alternative hypotheses under investigation.
- Assuming that the assumptions for regression inference are reasonable, find the t and P-value for the test.
- c) State your conclusion.

22. Sales and profits. A business analyst was interested in the relationship between a company's sales and its profits. She collected data (in millions of dollars) from a random sample of Fortune 500 companies, and created the regression analysis and summary statistics shown. The assumptions for regression inference appeared to be satisfied.

**Profits** Sales Dependent variable is: Profits Count 79 79 R-squared = 66.2% s = 466.2Mean 209.839 4178.29 Variable Coefficient SE(Coeff) Variance 635,172 49,163,000 Intercept -176.644 61.16 Std Dev 796.977 7011.63 Sales 0.092498 0.0075

- a) Is there a significant association between sales and profits? Test an appropriate hypothesis and state your conclusion in context.
- b) Do you think that a company's sales serve as a useful predictor of their profits? Use the values of both R<sup>2</sup> and s in your explanation.

3. No opinion. Here's a regression of the percentage of respondents whose response to the question about voting for a woman president was "no opinion." We wonder if the percentage of the public who have no opinion on this issue has changed over the years. Assume that the conditions for inference are satisfied.

Dependent variable is: No Opinion R-squared = 9.5%

s = 2.280 with 16 - 2 = 14 degrees of freedom

Variable	Coefficient	SE(Coeff)	t-ratio	P-value
Intercept	7.69262	2.445	3.15	0.0071
Year	-0.042708	0.0353	-1.21	0.2458

- a) State the appropriate hypothesis for the slope.
- Test your hypothesis and state your conclusion in the proper context.
- c) On the next page is the scatterplot corresponding to the regression for No Opinion. How does the scatterplot change your opinion of the trend in "no opinion" responses? Do you think the true slope is negative? Does this change the conclusion of your hypothesis test of part b? Explain.
- 10.0 5.0 7.5 0.0 -

**15. Cereal.** A healthy cereal should be low in both calories and sodium. Data for 77 cereals were examined and judged acceptable for inference. The 77 cereals had between 50 and 160 calories per serving and between 0 and 320 mg of sodium per serving. The regression analysis is shown.

Dependent variable is: Sodium

R-squared = 9.0%

s = 80.49 with 77 - 2 = 75 degrees of freedom

Variable	Coefficient	SE(Coeff)	t-ratio	P-value
Intercept	21.4143	51.47	0.416	0.6786
Calories	1.29357	0.4738	2.73	0.0079

- a) Is there an association between the number of calories and the sodium content of cereals? Explain.
- b) Do you think this association is strong enough to be useful? Explain.

**27. Printers.** In March 2002, Consumer Reports reviewed several models of inkjet printers. Shown are the speed of the printer (in pages per minute) and the cost per page printed. Is there evidence of an association between speed and cost? Test an appropriate hypothesis and state your conclusion.

Speed (ppm)	Cost (cents/page)		
4.6	12.0		
5.5	8.5		
4.5	6.2		
3.8	3.4		
4.6	2.6		
3.7	4.0		
4.7	5.8		
4.7	8.1		
4.0	9.4		
3.1	14.9		
1.9	2.6		
2.2	4.3		
1.8	4.6		
2.0	14.8		
2.0	4.4
